

SATARK Pod Lead — Founding Role

Crashfree India · A Cars24 Commitment · September 2026

The role

Crashfree India is hiring one person to build and run SATARK's national expansion — and to run it like their own company. SATARK is our AI enforcement platform for traffic police, live today in Jaipur, Bengaluru and Gurugram; page 2 explains exactly how it works. The mandate: take it to the 100 districts where India loses the most lives on its roads, by December 2027.

This is not a business-development role and not a policy desk. Nobody hands you a plan on Monday — the map of India is yours to draw.

What you will actually do

- Own the 100-district goal end to end: which districts, in what order, signed how. Your pipeline, your targets.
- Sit across police commissioners, transport secretaries and state ministries. Convince them, sign the MoUs, and stay engaged until officers are actually intercepting vehicles.
- Drive each deployment with our engineering and installation teams — make every city live, and keep it live.
- Build and lead a small team: one or two strong people alongside you, growing as the districts grow. You work directly with Crashfree India's leadership and Cars24's founders.

Who we are looking for

- You have run something of your own — a startup, a campaign, an organisation. Failed ventures count; failure teaches patience.
- A genuine instinct to serve. Officials can tell within minutes whether the person across the table cares about road deaths or is closing a sale. You have to be believed.
- Comfort with both speeds of government — Rajkot signed in nine days; Pune took five months.
- Diligence with government material: orders, procedures, and follow-ups that run for months.

Logistics

- Based in Gurugram, with heavy travel across states. Target joining: mid-October 2026.
- Compensation is discussed directly in the first conversation.

How to apply

1. **Acknowledge** this email by **26 September, end of day** — one line is enough.
2. Send two things to **Gajendra@crashfreeindia.org** by **28 September, end of day**:
 - Your CV.
 - A 4–5 minute video (a link is fine): pick a problem you genuinely care about — anything this country looks away from — and convince us it matters. Back it with data; anticipate our questions. We are not testing polish. We are testing conviction.
3. Shortlisted candidates have a conversation with the team, followed by a short 48-hour assignment.
4. Final conversations in Gurugram; offers go out by early October.

About SATARK

The system, the story so far, and where it goes next

What it is

SATARK is an AI enforcement platform built by Crashfree India with Cars24. It sits with traffic police and answers one question in real time: of all the vehicles passing this point, which one should an officer stop — and why. It turns records that already exist (pending challans, lapsed insurance, expired PUC, failed fitness) into action on the road.

How it started: the Challan Billboard

In Bengaluru, with the city traffic police, we put up India's first AI billboard at Trinity Circle. Cameras read passing number plates, checked them against government records, and flashed pending challans, lapsed insurance and expired PUC on the screen — to the drivers themselves, in about ten seconds. Fully compliant vehicles were congratulated. The campaign crossed 100 Mn+ views on social and was covered widely ([Deccan Herald](#) · [Media4Growth](#)). The billboard was the ad. SATARK is the product.

How it works

1. **Read.** ANPR cameras read every passing number plate, at a range of about 100 metres.
2. **Check.** Each plate is checked in real time against live government records: pending challans, insurance, PUC and fitness.
3. **Alert.** Within about ten seconds, the officer on the ground is told which vehicle to stop and exactly why.
4. **Intercept.** The vehicle is stopped, with a full audit trail for every action. The system reads the vehicle, not the person — owner identity stays masked.

Where it stands today

- Live in three cities: Jaipur, Bengaluru and Gurugram.
- 5.4 lakh+ vehicles screened · ₹53 crore+ in unpaid dues surfaced · 600+ police interceptions (*figures: September 2026*).
- Installation underway in four more: Pune, Rajkot, Gandhinagar and Thiruvananthapuram.

Why it matters

Every year India records around five lakh road crashes and loses 1.7 lakh lives — the silent equivalent of a Boeing crashing every single day. Much of this is systemic, not accidental: violations are detected, challans are issued, and then nothing happens. Crashfree India is Cars24's long-term commitment to rebuild the systems that keep people safe — not a CSR project. Enforcement is the first of those systems, and SATARK is where it is already working.

Where it goes next

The 100 districts where India loses the most lives, by December 2027 — districts signed, cameras installed, officers intercepting. That expansion is what the SATARK Pod Lead will own.
